Why study Java programming language at Cork College of Commerce night school?

Introduced in 1995, some of the biggest organisations in the world are built using Java programming language. Many banks, retailers, insurance companies, utilities, and manufacturers all use Java. A large proportion of government, healthcare, insurance, education, and defence departments have their web applications built in Java. A significant example of this is Google's Gmail.

Many I.T. experts have agreed that there is no sign of Java declining in use, instead, it is an evolving language that can help to make applications, web pages, games, computer software and other technology much more advanced and effective for users. As a beginner you will learn syntax, ideas, patterns, tools, styles, and logic that are readily transferable to other programming languages as well. It doesn't matter if you are young or old, straight out of college or retired, if you have the curiosity to learn to code, then this course is for you.

Statistics

97% of Enterprise Desktops run Java.

89% of Desktops (or Computers) in the U.S. run Java.

9 Million Java Developers worldwide.

Java is the number 1 choice for developers.
